

Configuring the Kontakt Configuration File

1) After installing the files, launch a standalone instance of Kontakt. Now, select the Output Button at the top of the window or simply right click the mouse button in the main Kontakt panel.

2) This will bring up a routing matrix at the bottom of the screen. Yours may look slightly different.

3) Click on the Presets/Batch Configuration button and select “Storyteller16OutsV1” from the dropdown menu.

You will notice that there are now a number of outputs for your Kontakt instruments. But before we explore these concepts, you will need to perform one more step to make sure this configuration is used every time Kontakt is launched from within Reaper.
