

A Quick Start Guide for Orchestral Template for Reaper (OTR)

Ready to get started and just want the highlight reel of what's important to know? Cool. These are the golden rules...

A note about installing... OTR is a self-contained install of Reaper + the OTR customization. It will not affect any other Reaper install you presently have on your system.

Don't forget... OTR comes with a Kontakt mapped output preset located in its "extras" folder. Don't forget to add it to Kontakt as your default Preset Output mapping to gain the full benefits of OTR. Further information on how to get this setup is located in the manual.

On Reaper updates... The Reaper DAW updates fairly regularly. To update the copy that is included in the OTR folder on Mac, simply download and move the latest Reaper.app file (and Reamote64.app) to the "Orchestral Template For Reaper" folder - which is located in your Applications folder. On Windows, run the latest Reaper installer and make sure you choose "portable install" and then select the original Orchestral Template For Reaper folder.
